

GENESIS COUPE(BK) >2010 > G 2.0 DOHC > Automatic Transmission System > Automatic Transmission System > Description and Operation

Description

The A5SR1 is a 5-speed, electronically controlled transmission featuring sports mode shifting. The control valve assembly features an integrated electronic control unit.

A5SR1

Item	Contents
Improved transmission feel	<ul style="list-style-type: none"> - Integrated control over engine and A/T (CAN communication control) system employed - Turbine sensor 1.2 employed - Real time feedback control at all phases applied
Improved driving	<ul style="list-style-type: none"> - Sports mode function employed - Gear ratio extension
Improved fuel consumption	<ul style="list-style-type: none"> - Full range lock-up employed (Larger lock-up zone) - E-flow torque converter employed (Improved driving efficiency) - Small transmission power train employed
Improved safety	<ul style="list-style-type: none"> - Transmission lock apparatus (P range maintenance apparatus affixed) employed
Improved maintenance	<ul style="list-style-type: none"> - Electronic system diagnosis tester (hi-scan) counterpart

Major Components And Their Functions

Part name	Acronyms	Function
Front brake	F/B	Fastens the front sun gear
Input clutch	I/C	Engages the input shaft, with the middle annulus gear and the front annulus gear
Direct clutch	D/C	Engages the rear planetary carrier with a rear sun gear
High & low reverse clutch	H&L R/C	Engages the middle sun gear with the rear sun gear
Reverse brake	R/B	Fastens the rear planetary carrier
Forward brake	FWD/B	Fastens the middle sun gear
Low cost brake	LC/B	Fastens the middle sun gear
1st one-way clutch	1st OWC	Allows the rear sun gear to turn freely forward relative to the mid sun gear but fastens it for reverse rotation
Forward one-way clutch	FWD OWC	Allows the mid sun gear to turn freely in the forward direction but fastens it for reverse rotation
3rd one-way clutch	3rd OWC	Allows the front sun gear to turn freely in the forward direction but fastens it for reverse rotation

Operation

Shift positions	I/C	H&LR/C	D/C	Rev/B	F/B	LC/B	Fwd/B	1st OWC	Fwd OWC	3rd OWC	Remarks
P		△			△						Park
R		○		○	○			○			Reverse
N		△			△						Neutral
D	1st	△*			△	△*△*	○	○	○	○	Automatic Shifting 1↔2↔3↔ 4↔5
	2nd		○		△	△*	○	○	○	○	
	3rd	○	○		○		△	△	○	○	
	4th	○	○				△	△			
	5th	○	○		○		△	△		△	

○ : Operates.

○ : Operates during accelerating.

◇ : Operates while vehicle is coasting.

◇ " : Operates only when Manual mode is selected.

△ : Operates but does not affect power transmission.

△ " : Operates in appropriate vehicle speed range.

Remark : Manual mode derivative is available

Operating Principles Of Each Range

1. N range

Since the forward and reverse brakes are released, driving force of input shaft is not transmitted to output shaft.

2. P range

- A. Since the forward and reverse brakes are released, as those in the N range, driving force of input shaft is not transmitted to output shaft.
- B. Parking pawl that is linked with select lever parking gear meshes with and fastens output shaft mechanically.

3. D, M2, M3, M4, M5 range 1st speed

- A. Fastens the front brake.
- B. The front brake and the forward one-way clutch regulate reverse rotation of the mid sun gear.
- C. The 1st one-way clutch regulates reverse rotation of the rear sun gear.
- D. The 3rd one-way clutch regulates reverse rotation of the front sun gear.

*** POWER FLOW**

Input shaft → Front internal gear → Front carrier → Rear internal gear → Rear carrier → Middle internal gear → Middle carrier → Output shaft

4. D, M3, M4, M5 range ratio 2nd

- A. Fasten the front brake.
- B. The front brake and the forward one-way clutch regulate reverse rotation of the mid sun gear.
- C. The 3rd one-way clutch regulates reverse rotation of the front sun gear.

- A. The direct clutch is coupled and the rear carrier and the rear sun gear are connected.

*** POWER FLOW**

Input shaft → Front internal gear → Front carrier → Rear internal gear → Rear carrier → Rear carrier → Middle internal gear → Middle carrier → Output shaft

5. D, M3, M4, M5 range 3rd speed

- A. Fastens the front brake.
- B. The 3rd one-way clutch regulates reverse rotation of the front sun gear.

C. The high & low reverse clutch is coupled and the middle and rear sun gears are connected.

* POWER FLOW

Input shaft → Front internal gear → Front carrier → Rear internal gear → Rear carrier → Middle internal gear → Middle carrier → Output shaft

6. D, M4, M5 range 4th speed

A. The front brake is released and sun gear turns freely forward.

B. The input clutch is coupled and the front and middle internal gears are connected.

C. Driving force is conveyed to the front internal gear, the middle internal gear, and the rear carrier and the three planetary gears rotate forward as a unit.

* POWER FLOW

Input shaft → Front internal gear → Front carrier → Rear internal gear → Rear carrier → Middle internal carrier → Middle carrier → Output shaft

7. D, M5 range 5th speed

A. The front brake fastens the front sun gear.

B. The direct clutch is released and the rear carrier and rear sun gear are disconnected.

*** POWER FLOW**

Input shaft → Front internal → Front carrier → Rear internal input shaft → Middle internal → Rear carrier → Rear sun gear → Middle sun carrier → Middle carrier → Output shaft

8. R range

- A. The front brake fastens the front sun gear.
- B. The high & low reverse clutch is coupled and the middle and rear sun gears are connected.
- C. The reverse brake fastens the rear carrier.

*** POWER FLOW**

Input shaft → Front internal → Front carrier → Rear internal → Rear sun gear → Middle sun gear → Middle carrier → Output shaft

Procedure of ATF level adjusting

1. Park the vehicle on a flat road and lock the tires.
2. Shift the shift lever to the "P" range.
3. Remove the overflow plug by using a torx wrench.

4. Remove the filler plug by using a torx wrench.

5. Check if ATF flows out of the overflow hole. If ATF does not drop, add ATF until it drops.
6. Fix the overflow plug by using Torx wrench.

NOTE

Reuse the used gasket.

7. Add 1400cc of ATF from the oil filling hole.
8. Install it to the filler plug with a new gasket.
9. Tighten the filler plug by using Torx wrench with the specified torque.

Tightening torque :

15~25 Nm (1.5~2.5 kgf.m, 11.1~18.4 lb-ft)

10. Start the engine.
11. Raise ATF temperature on CAN signal up to 50°C at stabilized idle speed condition.
12. Shift from "P" to "D", then from "D" to "P", keeping each shift position "N", "R" more than 2 seconds with foot braking.
13. Repeat 2 times above procedure "3".
14. Remove the overflow plug and the O-ring by using Torx wrench.

15. Check If the thin oil stream becomes drop by drop when ATF temperaturue on CAN signal is at 58~64°C.
16. Install it to the overflow plug with a new gasket.
17. Tighten the overflow plug by using Torx wrench with the specified torque.

Tightening torque :

35~45 Nm (3.6~4.6 kgf.m, 25.8~33.2 lb-ft)

NOTE

Be sure to wipe off spilled ATF completely after tightening the overflow plug.

Troubleshooting

Diagnostic Trouble Codes(Inspection Procedure)

Check the Diagnostic Trouble Codes

1. Turn the ignition switch to OFF.
2. Connect the Hi-scan tool to the DLC connector for diagnosis.
3. Turn the ignition switch to ON.
4. Check the diagnostic trouble codes using the Hi-scan tool.
5. Read the output diagnostic trouble codes. Then follow the remedy procedures according to the "DIAGNOSTIC TROUBLE CODE DESCRIPTION" on the following pages.

NOTE

- A maximum of 10 diagnostic trouble codes (in the sequence of occurrence) can be stored in the Random Access Memory (RAM) incorporated within the control module.
- The same diagnostic trouble code can be stored one time only.
- If the number of stored diagnostic trouble codes or diagnostic trouble patterns exceeds 10, already stored diagnostic trouble codes will be erased in sequence, beginning with the oldest.
- If the same trouble code does not occur during 40 times continuously, memorized trouble code would be deleted automatically when the ATF temperature reaches 50°C(122°F).

6. Delete the diagnostic trouble code.

7. Disconnect the Hi-scan tool.

NOTE

DTC cleaning should only be done with the scan tool.

Inspection Chart For Diagnostic Trouble Codes(DTC)

No.	Code	Item	MIL
1	P0601	Internal Control Module Memory Check Sum Error	•
2	P0641	Sensor Reference Voltage 'A' Circuit/Open	•

22	P0773	Shift Control Solenoid Valve 'E' Electrical(Low Coast Brake Solenoid)	•
23	U0001	High Speed CAN Communication Bus off	•
24	U0100	Lost Communication With ECM/PCM 'A'	

Component Location

General Description

A malfunction is detected by using a checksum technique for verifying data. The digital data is composed of zeros and ones. A checksum is the total of all ones in a string of data. By comparing the checksum value with a stored value, a malfunction can be detected.

DTC Description

By comparing the checksum value with a stored value, if the both data are not equal , TCM sets DTC P0601.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Rationality	• TCM
Enable Conditions	• IG "on"	
Threshold Value	• Checksum fault or TCU internal Failure	
Diagnostic Time	• More than 1sec	
Fail Safe	• Locked in 4th gear.	

Component Inspection

1. Ignition "ON" & Engine "OFF".
2. Connect GDS and erase the DTC P0601 with GDS.
3. Turn IG OFF ↔ IG ON 2 or 3 times then, check that DTC P0601 is set again.
4. Is the DTC P0601set again ?

YES	► Replace a known-good PCM/TCM as necessary and then go to "Verification of Vehicle Repair" procedure.
NO	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Throughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage.Repair or replace as necessary and go to "verification of vehicle repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.

3. Operate the vehicle within DTC Enable conditions in General information.

4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

The TCM monitors voltage supply to solenoid valve.

DTC Description

The TCM sets this code when supplying voltage to TCM is lower or higher than specification.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	<ul style="list-style-type: none">Check voltage range	
Enable Conditions	<ul style="list-style-type: none">Battery voltage > 9.7V

<input type="checkbox"/>	Turbin Speed Sensor 1					0	RPM	

Fig.1

Fig 1) Power Supply - Normal

- Does "BATTERY VOLTAGE and A/T MAIN RELAY VOLTAGE" follow the reference data?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "W/Harness Inspection" procedure.

Terminal & Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES	► Repair as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "Power circuit inspection" procedure.

Power Circuit Inspection

1. Connect the "PCM/TCM" connector.
2. IG "ON" & Engine "OFF".
3. Measure the voltage between "Solenoid Supply" terminal of solenoid valve connector and chassis ground.

Specification : Battery Voltage

4. Is the measured voltage within specifications?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "verification of vehicle repair" procedure.
NO	► Check open or short in harness. Repair as necessary and then, go to "Verification of Vehicle" procedure. ► If there is no problem in harness, substitute with know-good PCM/TCM and check for proper operation. If the problem is corrected, replace PCM/TCM as necessary and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

When the shift lever is in the D (Drive) position the output signal of Tansaxle Range Switch is 12V and in all other positions the voltage is 0V. The TCM judges the shift lever position by reading all signals, for the TRANSMISSION Range Switch, simultaneously.

DTC Description

The TCM sets this code when patterns are out of specification based on the table shown below.

The TRANSMISSION Range Switch has no output signal for an extended period of time.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Rationality	
Enable Conditions	• Sensor supply voltage in valid range OK	
Threshold Value	<ul style="list-style-type: none"> Intermediate position pattern or Undefined pattern Inhibitor switch pattern check Voltage of HW signal Voltage > 2.5V (If active) or Voltage < 2.5V (If not avtive) Jump pattern Jump more than 5 steps 	<ul style="list-style-type: none"> OPEN OR SHORT IN CIRCUIT Faulty TRANSMISSION RANGE SWITCH Faulty TCM

- : RANGE INDICATOR LAMP "OFF" AND MAINTAIN PREVIOUS RANGE

4. Is the measured resistance within specifications ?

YES	<ul style="list-style-type: none"> ► Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
NO	<ul style="list-style-type: none"> ► Check for open or short in harness. Repair as necessary and Go to "verification of vehicle repair" procedure. ► If signal circuit in harness is OK, Substitute with a known-good "TRANSMISSION RANGE SWITCH" and check for proper operation. If the problem is corrected, replace "TRANSMISSION RANGE SWITCH" as necessary and go to "verification of vehicle repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.

2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

GENESIS COUPE(BK) >2010 > G 2.0 DOHC > Automatic Transmission System > Automatic Transmission System > P0711 Transmission Fluid Temperature Sensor 'A' Circuit Range/Performance

Component Location

General Description

The automatic transmission fluid(ATF) temperature sensor A is installed in the INHIBITOR SWITCH and fluid(ATF) temperature sensor B is installed in the valve body. The TCM supplies a 5V reference voltage to the sensor, and the output voltage of the sensor changes when the ATF temperature varies.

DTC Description

This DTC code is set when the ATF temperature output voltage is lower than a value generated by thermistor resistance, in a normal operating range, for approximately 1 second or longer. The TCM regards the ATF temperature as fixed at a value of 80°C(176°F)

DTC Detectiong Condition

Item		Detecting Condition	Possible Cause

Fig 2) Open or short Data

4. Does "TRANSMISSION FLUID TEMPERATURE SENSOR " follow the reference data?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Throughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "W/Harness Inspection" procedure.

Terminal & Connector Inspection

- Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
- Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
- Has a problem been found?

YES	► Repair as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "Signal circuit inspection" procedure.

Signal Circuit Inspection

- Ignition "ON" & Engine "OFF".
- Disconnect ATM Control Unit connector.
- Measure voltage between signal terminal of AFT at the ATM Control Unit harness connector and chassis ground.

Specification : Refer to below table

[Inspection Table]

	Temperature(°C)	Resistance(KΩ)	Voltage(V)
ATF T/S 1	0°C(32°F)	Approx. 15KΩ	Approx. 3.3V
	20°C(68°F)	Approx. 6.5KΩ	Approx. 2.7V
	80°C(176°F)	Approx. 0.9KΩ	Approx. 0.9V
ATF T/S 2	0°C(32°F)	Approx. 10.5KΩ	Approx. 3.3V
	20°C(68°F)	Approx. 4.3KΩ	Approx. 2.5V
	80°C(176°F)	Approx. 0.5KΩ	Approx. 0.7V

4. Is the measured voltage within specifications ?

YES	► Go to "Component Inspection" procedure.
NO	► Check for open or short in harness. And repair as necessary and then, go to "Verification of Vehicle Repair" procedure.

Component Inspection

■ Check TCM

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "ATM Control Unit " connector.
3. Install GDS and select a SIMU-SCAN,
4. Simulate voltage (0→5V) to "TRANSMISSION FLUID TEMPERATURE SENSOR 1, 2" signal circuit.

Fig.1

Fig.2

Fig 1) Simulation Output 1.00V → 145°F

Fig 2) Simulation Output 2.00V → 80°F

※ It is subject to change vehicle condition.

5. Is FLUID TEMP. SENSOR signal value changed according to simulation voltage?

YES	► Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
NO	► Substitute with a known-good TCM and check for proper operation. If the problem is corrected, replace TCM as necessary and go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

The automatic transmission fluid(ATF) temperature sensor A is installed in the INHIBITOR SWITCH and fluid(ATF) temperature sensor B is installed in the valve body. The TCM supplies a 5V reference voltage to the sensor, and the output voltage of the sensor changes when the ATF temperature varies.

DTC Description

This DTC is for checking sensor failure. This code is set if the temperature data from Oil Temperture sensor is fixed between -20°C and 0°C or 0°C and 20°C for 10min. after driving a vehicle.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Circuit continuity-ground	※ ATF T/S :Automatic Transmission Fluid Temperature Sensor
Enable Conditions	• Battery voltage > 10V	• Open or Short to ground in circuit
Threshold Value	• Oil temperature sensor voltage < 0.05V	• Faulty ATF T/S 1
Diagnostic Time	• More thn 2 sec	• TCM
Fail Safe	• Fluid temperature is regarded as 80°C	

Specification

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

The Input Sensor of RXC Auto transmission is composed of S1(Sensor1) and S2(Sensor2). S1 inputs signal to TCM only at 4th gear and S2 does at 1st, 2nd, 3rd, 4th and 5th gear.

Therefore, sensing pulse frequency outputted from sensor 2, TCM calculates Inputshaft speed and compute Turbine rotation.. This value is mainly used to control the optimum fluid pressure during shifting.

DTC Description

The TCM sets this code if an output pulse-signal is not detected, from the INPUT SPEED SENSOR 1 or 2, when the vehicle is running faster than 24.85MPH(40km/h). The Fail-Safe function will be set by the TCM if this code is detected.

DTC Detecting Condition

Item		Detecting Condition	Possible Cause
DTC Strategy		• Speed range & Rationality	
Enable Conditions	Case 1(Too High)	• Battery Voltage >10V	
	Case 2 (Rationality)	• Battery Voltage >10V • The time after the last shift was finished > 500msec. • Output Speed > 200RPM • Engine Speed > 700RPM	
Threshold Value	Case 1(Too High)	• Input speed 1 \geq 10000rpm or Input speed 2 \geq 10000rpm	<ul style="list-style-type: none"> • Open or short in signal circuit • Open in power circuit • Open in ground circuit • Faulty input speed sensor 1or 2 • Faulty TCM
	Case 2 (Rationality)	• Input speed 1(1,2,3,5th gear) > 100rpm	
Diagnostic Time		• More than 2sec.	
Fail Safe		• Nt(Turbine speed 1) : fixed as 600rpm • Sports mode Inhibition • 5th gear Shifting Inhibition • Inhibition of pressure adaptation • Torque Conveter Clutch : OFF

5. Does "INPUT SPEED SENSOR" follow the reference data?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "W/Harness Inspection" procedure.

Terminal & Connector Inspection

- Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
- Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
- Has a problem been found?

YES	► Repair as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "Signal circuit inspection" procedure.

Signal Circuit Inspection

1. Ignition "ON" & Engine "OFF".
2. Disconnect "ATM Control Unit connector.
3. Measure voltage between signal terminal of TCM harness connector and chassis ground.

Specification : Approx. 12V

4. Is the measured voltage within specifications?

YES	► Go to "Ground circuit Inspection" procedure.
NO	► Check for open or short in harness. Repair as necessary and Go to "verification of vehicle repair" procedure. ► If signal circuit in harness is OK, Go to "Check TCM" of the "Component Inspection" procedure.

Ground Circuit Inspection

1. Ignition "OFF".
2. Disconnect ATM Control Unit connector.
3. Remove the "OIL PAN" from the vehicle.
4. Measure continuity between ground terminal of Turbine sensor and chassis ground.

Specification : Continuity

5. Is the measured resistance within specifications ?

YES	► Go to "Component inspection" procedure.
NO	► Check for open in harness. Repair as necessary and Go to "verification of vehicle repair" procedure.

Component Inspection

1. Ignition "ON" & Engine "OFF".
2. Disconnect "ATM Control Unit(CLG01-C)" connector.
3. Connect GDS and select 'Simulation Function"on the scanner.
4. Simulate duty pulse on signal terminal of "Input Speed Sensor 2" with scanner.
※ In a case of Input Speed Sensor 1, it is impossible to execute the simulation function.

※ The values are subject to change according to vehicle model or conditions

5. Is "Input Speed Sensor 1& 2" signal value changed according to simulation frequency?

YES	► Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
NO	► Substitute with a known-good TCM and check for proper operation. If the problem is corrected, replace TCM as necessary and go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

The Input Sensor of R&G Auto transmission is composed of S1(Sensor1) and S2(Sensor2). S1 inputs signal to TCM only at 4th gear and S2 does at 1st, 2nd, 3rd, 4th and 5th gear.

Therefore, sensing pulse frequency outputted from sensor 2, TCM calculates Inputshaft speed and compute Turbine rotation.. This value is mainly used to control the optimum fluid pressure during shifting.

DTC Description

The TCM sets this code if an output pulse-signal is not detected, from the INPUT SPEED SENSOR 1 or 2, when the vehicle is running faster than 40km/h. The Fail-Safe function will be set by the TCM if this code is detected.

5. Does "INPUT SPEED SENSOR" follow the reference data?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "W/Harness Inspection" procedure.

Terminal & Connector Inspection

- Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
- Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
- Has a problem been found?

YES	► Repair as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "Signal circuit inspection" procedure.

Signal Circuit Inspection

1. Ignition "ON" & Engine "OFF".
2. Disconnect "ATM Control Unit connector.
3. Measure voltage between signal terminal of TCM harness connector and chassis ground.

Specification : Approx. 12V

4. Is the measured voltage within specifications?

YES	► Go to "Ground circuit Inspection" procedure.
NO	► Check for open or short in harness. Repair as necessary and Go to "verification of vehicle repair" procedure. ► If signal circuit in harness is OK, Go to "Check TCM" of the "Component Inspection" procedure.

Ground Circuit Inspection

1. Ignition "OFF".
2. Disconnect ATM Control Unit connector.
3. Remove the "OIL PAN" from the vehicle.
4. Measure continuity between ground terminal of Turbine sensor and chassis ground.

Specification : Continuity

5. Is the measured resistance within specifications ?

YES	► Go to "Component inspection" procedure.
NO	► Check for open in harness. Repair as necessary and Go to "verification of vehicle repair" procedure.

Component Inspection

1. Ignition "ON" & Engine "OFF".
2. Disconnect "ATM Control Unit(CLG01-C)" connector.
3. Connect GDS and select 'Simulation Function"on the scanner.
4. Simulate duty pulse on signal terminal of "Input Speed Sensor 2" with scanner.
※ In a case of Input Speed Sensor 1, it is impossible to execute the simulation function.

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

The OUTPUT SPEED SENSOR outputs waveform signals according to the revolutions of the output shaft of the transmission. The Output Speed Sensor is installed in front of the Parking Gear to determine the Parking Gear rpms by counting the frequency of the pulses. This value, together with the throttle position data, is mainly used to decide the optimum gear position.

DTC Description

The TCM sets this code if the calculated value of the signals is noticeably different from the value calculated, using the Vehicle Speed Sensor output, when the vehicle is running faster than 18.6MPH(30km/h). The TCM will initiate the fail safe function if this code is detected.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

The value of the input shaft speed should be equal to the value of the output shaft speed, when multiplied by the 1st gear ratio, while the transaxle is engaged in the 1st gear. For example, if the output speed is 1000 rpm and the 1st gear ratio is 3.73, then the input speed is 3730 rpm.

DTC Description

This code is set if the value of input shaft speed is not equal to the value of the output shaft, when multiplied by the 1st gear ratio, while the transaxle is engaged in 1st gear. This malfunction is mainly caused by mechanical troubles such as control valve sticking or solenoid valve malfunctioning rather than an electrical issue.

★ : TEMPORARY WORKING.

NOTE

Stall test procedure in D1 and reason

Procedure

1. Warm up the engine

2. After positioning the select lever in "D", depress the foot brake pedal fully after that, depress the accelerator pedal to the maximum

* The slippage of 1st gear operating parts can be detected by stall test in D

Reason for stall test

1. If there is no mechanical defaults in A/T, every slippage occur in torque converter.

2. Therfore, engine revolution is output, but input and output speed revolution must be "zero" due to wheel's lock.

3. If 1st gear operating parts have faults, input speed revolution will be out.

4. If ouput speed revolution is output. It means that the foot brake force is not applied fully. Remeasuring is required.

5. Is the meausred "STALL TEST" within specifications?

YES	► Go to "signal check" as follow
NO	► Go to "Component inspection" procedure.

CAUTION

1. Do not let anybody stand in front of or behind the vehicle while this test is being carried out.

2. Check the A/T fluid level and temperature and the engine coolant temperature.

• Fluid level : At the hot mark on the oil level gauge.

• Fluid temperature : 176 °F~ 212 °F (80~100 °C).

• Engine coolant temperature : 176 °F~ 212 °F (80~100 °C).

3. Chock both rear wheel(left and right).

4. Pull the parking brake lever on with the brake pedal fully depressed.

5. The throttle should not be left fully open for more than eight second.

6. If carrying out the stall test two or more time, move the select lever to the "N" position and run the engine at 1,000 rpm to let the A/T fluid cool down before carrying out subsequent.

■ Signal Check

1. Connect GDS.

2. Engine "ON".

3. Monitor the "INPUT & OUTPUT SPEED SENSOR" parameter on the GDS.

4. Accelerate the Engine speed until about 2000 rpm in the 1st gear.

Specification : INPUT SPEED - (OUTPUT SPEED × 1st GEAR RATIO) ≥ 200 RPM

Current Data			
Sensor Name		Value	Unit
<input checked="" type="checkbox"/> Engine Speed		2239	RPM
<input checked="" type="checkbox"/> Current Gear		1ST GEAR	-
<input checked="" type="checkbox"/> Input Speed(PG-A)		2209	RPM
<input checked="" type="checkbox"/> Output Speed(PG-B)		577	RPM
<input checked="" type="checkbox"/> Torque Converter Clutch Slip		28	RPM
<input type="checkbox"/> I/C Solenoid Duty		0	%
<input type="checkbox"/> I/C Solenoid Current		800	mA
<input type="checkbox"/> I/C Solenoid Pressure		0.0	bar

5. Does "INPUT & OUTPUT SPEED SENSOR" within specifications?

YES	► Go to "Component Inspection" procedure.
NO	► Check for electrical noise of circuit in INPUT & OUTPUT SPEED SENSOR or Replace INPUT & OUTPUT SPEED SENSOR. Repair as necessary and Go to "verification of vehicle repair" procedure.

Component Inspection

1. Connect GDS.
2. Engine "ON".
3. Monitor the "OIL PRESSURE. S/W 1,2,3,5,6" parameter on the GDS.
4. Move select lever to "D" range and operate vehicle within 1st gear condition.

Current Data			
Sensor Name		Value	Unit
<input checked="" type="checkbox"/> Current Gear		1ST GEAR	-
<input checked="" type="checkbox"/> Oil Pressure Switch-2(LC/B)		ON	-

<input type="checkbox"/> Engine Speed		2285	RPM
<input type="checkbox"/> Vehicle Speed		19	MPH

5. Does "OIL PRESSURE. S/W 1,2,3,5,6 " follow the reference data?

YES	► Repair AUTO TRANSAXLE(Clutch or Brake) as necessary and Go to "verification of vehicle repair" procedure.
NO	► Replace AUTO TRANSAXLE (BODY CONTROL VALVE faulty) as necessary and Go to "verification of vehicle repair " procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

► Go to the applicable troubleshooting procedure.

YES	
NO	► System performing to specification at this time.

Component Location

General Description

The value of the input shaft speed should be equal to the value of the output shaft speed, when multiplied by the 2nd gear ratio, while the transaxle is engaged in the 2nd gear. For example, if the output speed is 1000 rpm and the 2nd gear ratio is 2.308, then the input speed is 2308 rpm.

DTC Description

This code is set if the value of input shaft speed is not equal to the value of the output shaft, when multiplied by the 2nd gear ratio, while the transaxle is engaged in 2nd gear. This malfunction is mainly caused by mechanical troubles such as control valve sticking or solenoid valve malfunctioning rather than an electrical issue.

NOTE

Stall test procedure in D4 and reason

Procedure

1. Warm up the engine

2. After positioning the select lever in "D" or "ON" of the HOLD SW (Operate UP SHIFT in case of "SPORTS MODE"), depress the foot brake pedal fully after that, depress the accelerator pedal to the maximum

* The slippage of 4th gear operating parts can be detected by stall test in D2

Reason for stall test

1. If there is no mechanical defaults in A/T, every slippage occur in torque converter.
2. Therfore, engine revolution is output, but input and output speed revolution must be "zero" due to wheel's lock.
3. If 4th gear operating parts have faults, input speed revolution will be out.
4. If ouput speed revolution is output. It means that the foot brake force is not applied fully. Remeasuring is required.

6. Is the meausred "STALL TEST " within specifications?

YES	► Go to "signal check" as follow.
NO	► Go to "Component inspection" procedure.

CAUTION

1. Do not let anybody stand in front of or behind the vehicle while this test is being carried out.
2. Check the A/T fluid level and temperature and the engine coolant temperature.
 - Fluid level : At the hot mark on the oil level gauge.
 - Fluid temperature : 176 °F~ 212 °F (80~100 °C).
 - Engine coolant temperature : 176 °F~ 212 °F (80~100 °C).
3. Chock both rear wheel(left and right).
4. Pull the parking brake lever on with the brake pedal fully depressed.
5. The throttle should not be left fully open for more than eight second.
6. If carrying out the stall test two or more time, move the select lever to the "N" position and run the engine at 1,000 rpm to let the A/T fluid cool down before carrying out subsequent.

■ Signal Check

1. Connect GDS.
2. Engine "ON" .
3. Monitor the "INPUT & OUTPUT SPEED SENSOR" parameter on the GDS.
4. Accelerate the Engine speed until about 2000 rpm in the 4th gear.

Specification : Input Speed /4th gear ratio - Output Speed ≥ 200rpm

<input checked="" type="checkbox"/> Oil Pressure Switch-3[I/C]	ON	-	
<input checked="" type="checkbox"/> Oil Pressure Switch-1[FR/B]	OFF	-	
<input checked="" type="checkbox"/> Oil Pressure Switch-6[H&L R/C]	ON	-	
<input type="checkbox"/> Engine Speed	2140	RPM	
<input type="checkbox"/> Vehicle Speed	56	MPH	

5. Does "OIL PRESSURE. S/W 1,2,3,5,6 " follow the reference data?

YES	► Repair AUTO TRANSAXLE(Clutch or Brake) as necessary and Go to "verification of vehicle repair" procedure.
NO	► Replace AUTO TRANSAXLE (BODY CONTROL VALVE faulty) as necessary and Go to "verification of vehicle repair " procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

► Go to the applicable troubleshooting procedure.

YES	
NO	► System performing to specification at this time.

Component Location

General Description

The value of the input shaft speed should be equal to the value of the output shaft speed, when multiplied by the 4th gear ratio, while the transaxle is engaged in the 5th gear. For example, if the output speed is 1,000 rpm and the 5th gear ratio is 0.840, then the input speed is 840 rpm.

DTC Description

This code is set if the value of input shaft speed is not equal to the value of the output shaft, when multiplied by the 5th gear ratio, while the transaxle is engaged in 5th gear. This malfunction is mainly caused by mechanical troubles such as control valve sticking or solenoid valve malfunctioning rather than an electrical issue.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• 5th gear incorrect gear ratio	
Enable Conditions	<ul style="list-style-type: none"> • The time after the last shift was finished > 1 sec. • Oil temperature $\geq -10^{\circ}\text{C}$(14°F) • Engine speed > 600RPM • Position Lever D • Input Speed > 600rpm • $1100\text{rpm} < \text{Output Speed(NAB)} < 6000\text{rpm}$ • Pre-Filtering 1 sec. 	<ul style="list-style-type: none"> • Faulty Input Speed Sensor • Faulty Output Speed Sensor • Faulty internal parts in transmission
Threshold Value	<ul style="list-style-type: none"> • Proportionality check between input speed and Output speed at 5th gear • Input speed > (Output speed *5th Gear Ratio)+200RPM (Rationality-high) • Input speed < (Output speed *5th Gear Ratio)-200RPM (Rationality-low) 	
Diagnostic Time	• More than 1sec	
Fail Safe	• 4th gear Limp-Home mode

YES	
NO	► System performing to specification at this time.

Component Location

General Description

The PCM/TCM controls the locking and unlocking of the Torque Converter Clutch (or Damper Clutch), to the input shaft of the transmission, by applying hydraulic pressure. The main purpose of T/C clutch control is to save fuel by decreasing the hydraulic load inside the T/C. The TCM outputs duty pulses to control the Damper Clutch Control Solenoid Valve(DCSV) and hydraulic pressure is applied to DC according to the DCC duty ratio value. When the duty ratio is high, high pressure is applied and the Damper Clutch is locked. The normal operating range of the Damper Clutch Control current is from 0.05A (unlocked) to 0.75A(locked).

DTC Description

The PCM/TCM increases the duty ratio to engage the Damper Clutch by monitoring slip rpms (difference value between engine speed and turbine speed).

To decrease the slip of the Damper Clutch, the TCM increases the duty ratio by applying more hydraulic pressure. When slip rpm does not drop under some value with 100% duty ratio, the PCM/TCM determines that the Torque Converter Clutch is stuck OFF and sets this code.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Rationality(Damper clutch open stuck)	
Enable Conditions	• Input speed > 0 • Duty of damper clutch solenoid valve 100%	※ Torque Converter Clutch = Damper Clutch • Faulty Torque Converte Clutch • Faulty Torque Converte Clutch Solenoid Valve • Faulty Valve Body • Fautly PCM/TCM
Threshold Value	• Amount of slip(engine speed-turbine speed) when DCSV is applied 100% duty • Engine speed-Input speed > 100 RPM	
Diagnostic Time	• More than 5sec	
Fail Safe	• Damper clutch "OFF"	

Diagnostic Circuit Diagram

Monitor GDS Data

1. Connect GDS to data link connector(DLC)
2. Engine "ON".
3. Select "D RANGE" and drive vehicle from 1st gear to 5th gear.
4. Monitor the "TORQUE CONVERTER(DAMPER) CLUTCH" parameter on the GDS.

Component Location

General Description

The PCM/TCM controls the locking and unlocking of the Torque Converter Clutch (or Damper Clutch), to the input shaft of the transmission, by applying hydraulic pressure. The main purpose of T/C clutch control is to save fuel by decreasing the hydraulic load inside the T/C. The TCM outputs duty pulses to control the Damper Clutch Control Solenoid Valve(DCCSV) and hydraulic pressure is applied to DC according to the DCC duty ratio value. When the duty ratio is high, high pressure is applied and the Damper Clutch is locked. The normal operating range of the Damper Clutch Control current is from 0.05A (unlocked) to 0.75A(locked).

DTC Description

The TCM checks the Damper Clutch Control Signal by monitoring the feedback signal from the solenoid valve drive circuit. If an unexpected signal is monitored, (For example, high voltage is detected when low voltage is expected, or low voltage is detected when high voltage is expected) the TCM judges that the DCCSV circuit is malfunctioning and sets this code.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Check voltage range(Open, Shrot)	※ Torque Converter Clutch = Damper Clutch
Enable Conditions	• 10V < Actuator Supply Voltage < 16V	• Faulty Torque Converte Clutch • Faulty Torque Converte Clutch Solenoid Valve

6. Is the measured "TCC SLIP(DAMPER CLUTCH SL.RPM)" within specifications ?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "W/Harness Inspection" procedure.

Terminal & Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.

2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.

3. Has a problem been found?

YES	► Repair as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "Power circuit inspection" procedure.

Power Circuit Inspection

1. Connect "ATM Control Unit(CHG75-3)" connector.

2. IGNITION "ON", ENGINE "OFF".

3. Measure voltage between power terminal of LU solenoid valve and chassis ground.

Specification : Approx. Battery Voltage

4. Is the measured voltage within specifications ?

YES	► Go to "Component Inspection" procedure.
NO	<p>► Check for open or short in harness. Repair as necessary and then, go to "Verification of Vehicle Repair" procedure.</p> <p>► If the power circuit is O.K, Substitute with a known-good TCM and check for proper operation. If the</p>

problem is corrected, replace TCM as necessary and go to "verification of vehicle repair" procedure.

Component Inspection

■ Check TCC Solenoid Valve

1. Connect GDS.
2. IGNITION "ON", ENGINE "OFF".
3. Select Torque Converter Solenoid Valve in Actuation Test and Perform Actuation Test.

Specification : Operation

4. Does the solenoid valve operates when actuation test ?

YES	► Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
NO	► Substitute with a known-good Torque Converter Solenoid Valve and check for proper operation. If the problem is corrected, replace Torque Converter Solenoid Valve as necessary and go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

The line pressure solenoid valve regulates the oil pump discharge pressure to suit the driving condition in response to a signal sent from the TCM. The line pressure duty cycle valve is not consistent when the closed throttle position signal is "ON".

DTC Description

To confirm the line pressure duty cycle at low pressure, the accelerator (throttle) should be open until the closed throttle position signal is "OFF".

6. Does the "Pressure Control Solenoid Valve" follow the reference data ?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "W/Harness Inspection" procedure.

Terminal & Connector Inspection

- Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
- Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
- Has a problem been found?

YES	► Repair as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "Power circuit inspection" procedure.

Power Circuit Inspection

- Disconnect "ATM Control Unit connector.
- IGNITION "ON", ENGINE "OFF".
- Measure voltage between power terminal of Pressure control Solenoid Valve harness connector and chassis ground.

Specification : Approx. Battery Voltage

4. Is the measured voltage within specifications ?

YES	► Go to "Component Inspection" procedure.
NO	<p>► Check for open or short in harness. Repair as necessary and then, go to "Verification of Vehicle Repair" procedure.</p> <p>► If the power circuit is O.K, Substitute with a known-good TCM and check for proper operation. If the</p>

problem is corrected, replace TCM as necessary and go to "verification of vehicle repair" procedure.

Component Inspection

■ Check Pressure Control Valve

1. Disconnect " ATM Solenoid Valve connector.
2. Ignition "OFF".
3. Measure continuity between ground terminal of PL Solenoid and chassis ground.

Specification : Approx. 3~9Ω

4. Is the measured resistance within specifications ?

YES	▶ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
NO	▶ Check for open or short in harness. Repair as necessary and then, go to "Verification of Vehicle Repair" procedure. ▶ If the power circuit is O.K, Substitute with a known-good TCCSV and check for proper operation. If the problem is corrected, replace TCCSV as necessary and go to "verification of vehicle repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	▶ Go to the applicable troubleshooting procedure.
NO	▶ System performing to specification at this time.

Component Location

General Description

The Automatic Transmission changes the gear position of the transmission utilizing a combination of Clutches and Brakes, which are controlled by solenoid valves. Input clutch solenoid valve is controlled by the TCM in response to signals sent from the inhibitor switch, vehicle speed sensor and accelerator pedal position sensor (throttle position sensor). Gears will then be shifted to the optimum position.

DTC Description

This is not only caused by electrical malfunction (circuits open or shorted) but also by mechanical malfunction such as control valve sticking, improper solenoid valve operation.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Voltage range Check (Open, Short)	
Enable Conditions	• 10V < Actuator Supply Voltage < 16V	• Open or short in circuit
Threshold Value	• Hardware IC check	• Faulty pressure switch 3 • Faulty I/C solenoid valve
Diagnostic Time	• More than 0.2sec	• Faulty TCM
Fail Safe	• Locked as 4th gear	

Diagnostic Circuit Diagram

Monitor GDS Data

1. Connect GDS to data link connector(DLC)
2. Engine "ON".
3. Monitor the "I/C SOLENOID" parameter on the GDS.
4. Select "D RANGE" and Operate the vehicle.
5. Check "I/C SOLENOID" parameter value changes while driving.

Specification : Changeable correspondence with each gear position

6. Does the "Shift Control Solenoid Valve" follow the reference data ?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or PCM/TCM's connector or was repaired and PCM/TCM memory was not cleared. Throughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "W/Harness Inspection" procedure.

Terminal & Connector Inspection

- Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
- Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
- Has a problem been found?

YES	► Repair as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "Power circuit inspection" procedure.

Power Circuit Inspection

- Connect "ATM Control Unit connector.
- IGNITION "ON", ENGINE "OFF".
- Measure voltage between power terminal of DC solenoid valve harness connector and chassis ground.

Specification : Approx. Battery Voltage

4. Is the measured voltage within specifications ?

YES	► Go to "Component Inspection" procedure.
NO	<p>► Check for open or short in harness. Repair as necessary and then, go to "Verification of Vehicle Repair" procedure.</p> <p>► If the power circuit is O.K, Substitute with a known-good TCM and check for proper operation. If the</p>

problem is corrected, replace TCM as necessary and go to "verification of vehicle repair" procedure.

Component Inspection

■ Check shift solenoid valve "DC"

1. Disconnect " ATM Solenoid Valve connector.
2. Ignition "OFF".
3. Measure continuity between ground terminal of DC Solenoid and chassis ground.

Specification : Approx. 3~9Ω

4. Is the measured resistance within specifications ?

YES	▶ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
NO	▶ Check for open or short in harness. Repair as necessary and then, go to "Verification of Vehicle Repair" procedure. ▶ If the power circuit is O.K, Substitute with a known-good TCCSV and check for proper operation. If the problem is corrected, replace TCCSV as necessary and go to "verification of vehicle repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	▶ Go to the applicable troubleshooting procedure.
NO	▶ System performing to specification at this time.

Component Location

General Description

The Automatic Transmission changes the gear position of the transmission utilizing a combination of Clutches and Brakes, which are controlled by solenoid valves. High&low reverse clutch solenoid valve is controlled by the TCM in response to signals sent from the inhibitor switch, vehicle speed sensor and accelerator pedal position sensor (throttle position sensor). Gears will then be shifted to the optimum position.

DTC Description

The PCM/TCM checks the Shift Control Solenoid Valve E control signal by monitoring the feedback signal from the solenoid valve drive circuit. If an unexpected signal is monitored, (For example, high voltage is detected when low voltage is expected, or low voltage detected when high voltage is expected)

DTC Detection Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Check voltage range(Open, Short)	
Enable Conditions	• 10V < Actuator Supply Voltage < 16V	• Open or short in circuit • Faulty Pressure Switch 6
Threshold Value	• Hardware IC check	• Faulty H&L R/C solenoid valve
Diagnostic Time	• More than 0.2sec	• Faulty TCM
Fail Safe	• Locked as 4th gear	

Diagnostic Circuit Diagram

Monitor GDS Data

1. Connect GDS to data link connector(DLC)
2. Engine "ON".
3. Monitor the "H& LR/C SOLENOID" parameter on the GDS.
4. Select "D RANGE" and Operate the vehicle.
5. Check ""H& LR/C SOLENOID" parameter value changes while driving.

Specification : Changeable correspondence with each gear position

NO	► System performing to specification at this time.

Component Location

General Description

The TCM can either receive data from the Engine Control Module or ABS control module, or it can send data to the ECM and ABSCM by using CAN communication. The CAN communication is one of the vehicle communications method, which is now widely used to transfer the vehicle data.

DTC Description

The TCM reads data on the CAN-BUS line and checks whether the data is equal to the data which the TCM sent before. If the data is not the same the TCM decides that either the CAN-BUS line or TCM are malfunctioning and sets this code.

DTC Detectiong Condition

4. Does "CAN BUS LINE DATA" follow the reference data?

YES	► Fault is intermittent caused by poor contact in the sensor's and/or TCM(PCM)'s connector or was repaired and TCM(PCM) memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification Vehicle Repair" procedure.
NO	► Go to "W/Harness Inspection" procedure.

Terminal & Connector Inspection

- Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
- Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
- Has a problem been found?

YES	► Repair as necessary and go to "verification of vehicle repair" procedure.
NO	► Go to "Signal circuit inspection" procedure.

Signal Circuit Inspection

- Ignition "OFF".
- Disconnect "ECU" connector.
- Measure resistance between CAN high terminal and CAN low terminal of PCM/TCM harness connector.

Specification : Approx. $120 \Omega \pm 10\Omega$

- Is the measured resistance within specifications ?

YES	► Substitute with a known-good "PCM/TCM" and check for proper operation. If the problem is corrected, replace "PCM/TCM" and Go to "verification of vehicle repair" procedure.
NO	► Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage and resistor for CAN communication is open. Repair as necessary and then, go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

- Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.

2. Using a GDS, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES	► Go to the applicable troubleshooting procedure.
NO	► System performing to specification at this time.

Component Location

General Description

The TCM can either receive data from the Engine Control Module or ABS control module, or it can send data to the ECM and ABSCM by using CAN communication. The CAN communication is one of the vehicle communications method, which is now widely used to transfer the vehicle data.

DTC Description

The TCM reads data on the CAN-BUS line and checks whether the data is equal to the data which the TCM sent before. If the data is not the same the TCM decides that either the CAN-BUS line or TCM are malfunctioning and sets this code.

DTC Detectiong Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	<ul style="list-style-type: none"> Message Check 	
Enable Conditions	<ul style="list-style-type: none"> IG "ON" Battery Voltage > 10V Input Speed > 300rpm 	<ul style="list-style-type: none"> Open or short in CAN line Faulty ECM Faulty TCM
Threshold Value	<ul style="list-style-type: none"> BUS OFF 	
Diagnostic Time	<ul style="list-style-type: none"> More than 2sec. 	
Fail Safe	<ul style="list-style-type: none"> Default value

Signal Waveform & Data

Fig.1

Fig 1) "CAN Communication"

Monitor GDS Data

1. Connect GDS to data link connector(DLC)
2. Engine "ON".
3. Monitor the "CAN COMMUNICATION SERVICE DATA (ENGINE RPM, VEHICLE SPEED SENSOR, THROTTLE P. SENSOR)" parameters on the GDS.

Components

1. Parking gear	14. Oil pump housing	27. Middle planetary carrier
2. Output shaft	15. Stator	28. Input clutch drum
3. Control valve upper body	16. Impeller assembly	29. Input shaft
4. Control valve lower body	17. Turbine & lockup assembly	30. Front annulus gear
5. Separator plate assembly	18. Torque converter cover assembly	31. Direct clutch return spring
6. Rear sun gear	19. Front pinion gear	32. Direct clutch piston
7. Rear sun plate	20. Front planetary carrier	33. Reverse brake hub
8. Middle sun gear assembly	21. Front sun gear	34. Direct clutch assembly
9. Rear annulus gear assembly	22. Front brake drum	35. High & low reverse clutch return spring
10. Rear annulus cell	23. Rear pinion gear	36. High & low reverse clutch piston
11. Automatic transmission case	24. Rear planetary carrier	37. High & low reverse clutch assembly
12. Converter housing	25. Middle annulus gear	38. Low coast brake clutch assembly
13. Oil pump cover	26. Middle pinion gear	39. Forward one-way clutch

Removal

1. Disconnect (-) terminal from the battery in order to prevent current from flowing through wire.

2. Remove the ground wire (A) by removing a bolt.

3. Disconnect the connectors (A).

4. Remove the CKP sensor (A) by removing a bolt.

5. Remove the shift link (A) from the transmission by pulling out the snap pin.

6. Remove the propeller shaft from the transmission by removing bolts (A-3ea).

7. Remove the oil cooler tube assembly (A) by removing bolts(2ea).

8. Remove the under shield cover (A).

9. After supporting the transmission assembly with a jack, remove the crossmember from the vehicle by removing bolts(4ea).

10. Remove the torque converter mounting bolts(6ea) by rotating the crankshaft.

11. Remove the mounting bolts (A-4ea) lower in the engine side.

12. Remove the mounting bolts(2ea) both sides in the engine side.

13. Remove the starter motor mounting bolts (A-2ea).

14. Remove the mounting bolts (A-2ea) on the transmission.

15. Remove the transmission assembly from the engine assembly and lower the jack.

CAUTION

Be careful not to damage tubes, hoses or wire.

NOTE

In case remove the transmission mounting bracket assembly from the transmission assembly.

Tightening torque:

50~65 Nm (5.0~6.5 kgf.m, 36.2~47.0 lb-ft)

Installation

1. Temporarily install the transmission assembly by lifting the supporting jack.

CAUTION

Be careful not to damage tubes, hoses or wire.

2. Install the mounting bolts (A-2ea) on the transmission.

Tightening torque:

43~55 Nm (4.3~5.5 kgf.m, 31.1~39.8 lb-ft)

3. Install the starter motor mounting bolts (A-2ea).

Tightening torque:

43~55 Nm (4.3~5.5 kgf.m, 31.1~39.8 lb-ft)

4. Install the mounting bolts(2ea) both sides in the engine side.

Tightening torque:

35~47 Nm (3.5~4.7 kgf.m, 25.3~34.0 lb-ft)

5. Install the mounting bolts (A-4ea) lower in the engine side..

Tightening torque:

43~49 Nm (4.3~4.9 kgf.m, 31.1~35.4 lb-ft)

6. Install the torque converter mounting bolts(6ea) by rotating the crankshaft.

Tightening torque:

46~53 Nm (4.6~5.3 kgf.m, 33.3~38.3 lb·ft)

7. Install the crossmember from the vehicle by installing bolts(4ea) and put aside the supporting jack.

Tightening torque:

50~65 Nm (5.0~6.5 kgf.m, 36.2~47.0 lb·ft)

8. Install the under shield cover (A).

9. Install the oil cooler tube assembly (A) by installing bolts(2ea).

10. Install the propeller shaft to the transmission by installing bolts (A-3ea).

Tightening torque:

90~110 Nm (9~11 kgf.m, 65.0~79.5 lb·ft)

11. Install the shift link (A) to the transmission by inserting the snap pin.

12. Install the CKP sensor (A) by installing a bolt.

13. Connect the connectors (A).

14. Install the ground wire (A) by installing a bolt.

15. Connect (-) terminal to the battery.

16. Check the level of oil fluid. (refer to Procedure of ATF level adjusting)
